Security Engineer

Focused on web application security and reverse engineering. Hands-on experience identifying and documenting vulnerabilities in real-world systems, including government infrastructure.

EXPERIENCE

Founder & Technical Lead | Requion

2026 – Present

- Lead web application auditing and security compliance work for clients
- Identified vulnerabilities in real-world web applications, including systems operated by the Pakistan government
- Perform manual and tool-assisted testing for XSS, SQLi, CSRF, IDOR, and broken access control issues
- Provide remediation guidance and security hardening recommendations
- Work fully remote, managing scoping, testing, reporting, and client communication independently

Independent Security Researcher

2019 – Present

- Built practical skills in web exploitation through hands-on testing of real-world systems
- Developed working knowledge of network-level attacks including MITM, DNS spoofing, and ARP poisoning
- Self-taught across security domains since 2019 through structured online learning and lab environments
- Maintain a home lab for testing exploits, analyzing malware, and practicing attack techniques safely. I have a personal Home server which I made buy salvaging an old laptop, I use it as a testing victim machine.

Freelance Developer | Self-employed

2019 – 2022

- Worked on full-stack development projects, which directly informs security testing by understanding how modern web apps are built and where they fail

PROJECTS:

Web Application Security Audits

- Documented multiple real-world vulnerabilities including XSS, SQLi, CSRF, and IDOR across client systems. Findings included practical exploitation steps and prioritized remediation plans.

Malware Reverse Engineering

- Analyzed malicious scripts to understand behavior, delivery mechanisms, and indicators of compromise. Research conducted in isolated lab environments; a VBA script was found inside a pirated spotify application which I took apart and found out that it was a sophisticated Infostealer.

SOC-In-A-Bot

- An LLM powered Discord bot that enriches SIEM alert data with additional insights and mitigation guides. Built with Golang + OpenRouter + sqlite + suricata .

TECHNICAL SKILLS:

Web Application Security

- XSS, CSRF, SQLi, Broken Access Control, IDOR, OWASP TOP 10, more
- Web application auditing

Network Security

- MITM, DNS/ARP poisoning, Reverse Engineering, Script-based malware reverse engineering
- Security hardening

Programming Languages

- JavaScript built multiple full-stack projects; No.1 tool to spin up a helper script for API pentesting
- Go recently adopted for blazing fast networking capabilities. Scraping is alot faster in Go than Javascript.
- C systems programming enthusiast.
- Python regular use for task automation and scripting. Only use it when a library is only available in python

Linux & Systems

- Linux Systems Administration setup and management of services and containers
- Linux Server Configuration web server configuration and deployment
- Docker containerization & management. Have worked with container networking
- Kali Linux Entry-level practical knowledge of penetration testing, exploitation, and ethical hacking workflows

Information Security / Security

- SIEM Management and configuration know-how. Used suricata to protect servers from unauthorized access.

- Soft Skills:** Tech support, Computer hardware, Communication

Bachelor in Cyber Security

Dawood University of Technology, In progress, expected 2028 CGPA: 3.49

- Primary Education from recognized School and College. (irrelevant to mention)

Google Cybersecurity Professional Certificate
